

Consumption Heterogeneity: Micro Drivers and Macro Implications

Edmund Crawley

Andreas Kuchler

Federal Reserve Board

Danmarks Nationalbank

CEBRA

September 2, 2020

Viewpoints and conclusions stated in this paper are the responsibility of the authors alone and do not necessarily reflect the viewpoints of the Federal Reserve Board or Danmarks Nationalbank.

We estimate the **consumption response**
to permanent and transitory **shocks to income**
for **different groups** of households

Hasn't This Been Done Before?

Yes, but...

Our **method** addresses bias in previous results

Our **data** allows sharp focus on household heterogeneity

Hasn't This Been Done Before?

Time Aggregation Problem

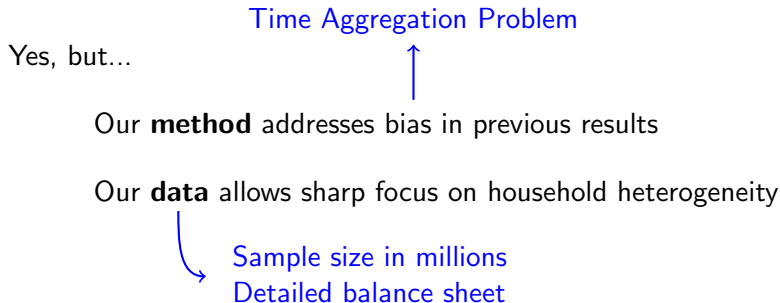

Yes, but...

Our **method** addresses bias in previous results

Our **data** allows sharp focus on household heterogeneity

Hasn't This Been Done Before?

Why Do We Care? (as macroeconomists)

- 1) Heterogenous agent models have testable micro behavior
- 2) Quantify Macro Implications

Why Do We Care? (as macroeconomists)

e.g. Consumption smoothing requires liquid wealth

- 1) Heterogenous agent models have testable micro behavior
- 2) Quantify Macro Implications

Why Do We Care? (as macroeconomists)

e.g. Consumption smoothing requires liquid wealth

1) Heterogenous agent models have testable micro behavior

2) Quantify Macro Implications

e.g. Redistribution in Monetary Policy

What do we find? (Liquid Wealth)

Low Liquid Wealth Households:

- Hand-to-Mouth
- Spend 85 cents out of every marginal dollar, both transitory and permanent

What do we find? (Liquid Wealth)

Low Liquid Wealth Households:

- Hand-to-Mouth
- Spend 85 cents out of every marginal dollar, both transitory and permanent

High Liquid Wealth Households:

- Large Response to Transitory Shocks (25 cents per dollar)
- Small Response to Permanent Shocks (60 cents per dollar)

relative to Permanent Income Hypothesis or Buffer-Stock models

What do we find? (Liquid Wealth)

Low Liquid Wealth Households:

- Hand-to-Mouth
- Spend 85 cents out of every marginal dollar, both transitory and permanent

High Liquid Wealth Households:

- Large Response to Transitory Shocks (25 cents per dollar)
- Small Response to Permanent Shocks (60 cents per dollar)

relative to Permanent Income Hypothesis or Buffer-Stock models

Liquid wealth accurately predicts MPCs across all other dimensions we look at

What do we find? (Redistribution in Monetary Policy)

What do we find? (Redistribution in Monetary Policy)

Medium MPX
 ≈ 0.5

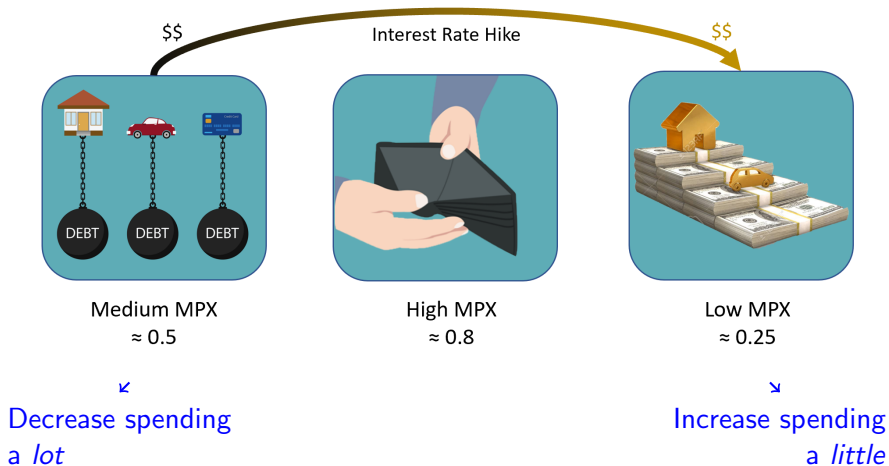

High MPX
 ≈ 0.8

Low MPX
 ≈ 0.25

MPX: Marginal Propensity to eXpend (includes durables)

What do we find? (Redistribution in Monetary Policy)

What do we find? (Redistribution in Monetary Policy)

1yr rate \uparrow 1%

Aggregate Spending \downarrow 26 basis points

Through this redistribution channel *alone*

How Do We Do This? Reduced Form Approach

Identifying Restrictions on

Income

and

Consumption

In **Continuous** Time

But first some intuition: Naïvely Regress

Change in Consumption on Change in Income (over N years)

Naïve Regression: Consumption Growth on Income Growth

$$\Delta^N c_i = \alpha^N + \beta^N \Delta^N y_i + \varepsilon_i$$

Naïve Regression: Consumption Growth on Income Growth

$$\Delta^N c_i = \alpha^N + \beta^N \Delta^N y_i + \varepsilon_i$$

Naïve Regression: Consumption Growth on Income Growth

$$\Delta^N c_i = \alpha^N + \beta^N \Delta^N y_i + \varepsilon_i$$

Naïve Regression: Consumption Growth on Income Growth

$$\Delta^N c_i = \alpha^N + \beta^N \Delta^N y_i + \varepsilon_i$$

Naïve Regression: Consumption Growth on Income Growth

$$\Delta^N c_i = \alpha^N + \beta^N \Delta^N y_i + \varepsilon_i$$

Why Not Blundell, Pistaferri and Preston 2008?

Key to BPP Identification

Transitory shock year t

$\Delta y_{t+1} = \Delta p_{t+1} + \Delta \varepsilon_{t+1}$ is a *valid instrument* for ε_t 

Why Not Blundell, Pistaferri and Preston 2008?

Key to BPP Identification

Transitory shock year t

$\Delta y_{t+1} = \Delta p_{t+1} + \Delta \varepsilon_{t+1}$ is a *valid instrument* for ε_t

- Negatively correlated with transitory shocks in year t

Why Not Blundell, Pistaferri and Preston 2008?

Key to BPP Identification

Transitory shock year t

$\Delta y_{t+1} = \Delta p_{t+1} + \Delta \varepsilon_{t+1}$ is a *valid instrument* for ε_t

- Negatively correlated with transitory shocks in year t

- Uncorrelated with permanent shocks in year t

Why Not Blundell, Pistaferri and Preston 2008?

Key to BPP Identification

Transitory shock year t

$\Delta y_{t+1} = \Delta p_{t+1} + \Delta \varepsilon_{t+1}$ is a *valid instrument* for ε_t

- Negatively correlated with transitory shocks in year t

- Uncorrelated with permanent shocks in year t

Fails due to the **Time Aggregation Problem**

Time Aggregation Problem in BPP (Crawley 2018)

Time Aggregation Problem in BPP (Crawley 2018)

Time Aggregation Problem in BPP (Crawley 2018)

Observed permanent income growth is *positively* autocorrelated

BPP misinterprets *positive* permanent income shocks as *negative* transitory shocks

⇒ Thinks negative transitory shocks result in consumption *increasing*

Time Aggregation Problem in BPP (Crawley 2018)

Observed permanent income growth is *positively* autocorrelated

BPP misinterprets *positive* permanent income shocks as *negative* transitory shocks

⇒ Thinks negative transitory shocks result in consumption *increasing*

If the Permanent Income Hypothesis holds, BPP will estimate the MPC to be -0.6

What we need:

- Panel Data on **Income** and **Expenditure**
- Household **Balance Sheets**

What we need:

- Panel Data on **Income** and **Expenditure**
- Household **Balance Sheets**

What we have: Registry data for all Danish households

- **Income**

Third party reported

After-tax, restrict to heads aged 30-55

- **Balance Sheet**

Wealth on 31 Dec

Asset category, mortgage tenure

Danish Mortgage Market

- **Expenditure**

No *direct* measure of spending

Intertemporal budget constraint

$$\text{Expenditure} = \text{Income} - \text{Saving}$$

Intertemporal budget constraint

$$\begin{aligned} \text{Expenditure} &= \text{Income} - \text{Saving} \\ &\quad \downarrow \\ &= \text{Change in Net Worth} \\ &\quad (\text{adj. for capital gains}) \end{aligned}$$

Intertemporal budget constraint

$$\text{Expenditure} = \text{Income} - \text{Saving}$$

↓
= Change in Net Worth
(adj. for capital gains)

- Works well for households with simple financial lives
- Problem: Capital gains
 - Houses off balance sheet (exclude transaction years)
 - Exclude business owners
 - Capital gains based on a diversified index
- Noisy, but perhaps better than surveys (Kuchler et al. 2018)
- Huge sample size advantage: sample covers 7.6 million observations over 2004-2015

Summary Statistics

Measurement Error

Results by Liquid Wealth

MPX by Net Wealth

MPX Results are Robust to Misspecification

MPX by Net Wealth

MPX by Unhedged Interest Rate Exposure

MPX by Unhedged Interest Rate Exposure

MPX by Unhedged Interest Rate Exposure

Liquid Wealth Predicts MPX Across Other Dimensions

Median liquid wealth predicts MPX to approximately four percentage points

New Method to Estimate Consumption Behavior

- Corrects for Bias in BPP
- Estimates align with natural experiment literature
- Potential to use on a wide variety of datasets and applications

Applied to Danish Registry Data

- Sample Size \implies Sharp Focus on Heterogeneity
- High MPC from transitory shocks, Low MPC from Permanent shocks
- Liquid Wealth sufficient to determine MPC
- Quantify Monetary Policy Transmission Channels

Thank you!

We have data on value of household cars

- Construct expenditure excluding car purchases and sales

$$C_T^{\text{nocar}} = C_T - \Delta\text{CarValue}$$

- Construct proxy for non durable consumption (Cars \approx 42.1% durable expenditure)

$$C_T^{\text{nondurable}} = C_T - \frac{1}{0.421} \Delta\text{CarValue}$$

Evidence of Consumption Decay Within 2 Years

From Fagereng, Holm,
and Natvik (2016)

Back

From Gelman (2016)

Figure 10: Tax refund impulse response function

Notes: 1,445,560 observations from 48,050 individuals. The vertical bars on each coefficient represent 95% confidence intervals using heteroskedasticity robust errors clustered at the individual level.

URE	-28,052	-12,627	108,382	-47,589	-19,374	243,604
NNP	-109,685	-65,810	156,523	-158,321	-85,207	542,498
No. Household-year obs	7,664,360			18,050,340		

Notes: Values are 2015 USD. Age refers to the age in 2008 of the main income earner in the household. For the purposes of calculation of consumption in the population, top and bottom 1% in terms of consumption have been excluded. URE and NNP can only be calculated in the period 2009-2015 due to mortgage information being insufficiently detailed in the previous years.

Back

Data: When is Measurement Error a Problem?

We have the same issues as the regression:

$$\Delta c_i = \alpha + \beta \Delta y_i + \varepsilon_i$$

That is measurement error in:

Δy_i leads to attenuation bias

Δc_i should be uncorrelated with Δy_i

Data: When is Measurement Error a Problem?

We have the same issues as the regression:

$$\Delta c_i = \alpha + \beta \Delta y_i + \varepsilon_i$$

That is measurement error in:

Δy_i leads to attenuation bias

↗ High quality income data

Δc_i should be uncorrelated with Δy_i

Data: When is Measurement Error a Problem?

We have the same issues as the regression:

$$\Delta c_i = \alpha + \beta \Delta y_i + \varepsilon_i$$

That is measurement error in:

Δy_i leads to attenuation bias

↗ High quality income data

Δc_i should be uncorrelated with Δy_i

When might this fail?

- Off balance sheet saving
- Returns correlated with *changes* in income (e.g. stock compensation)
- When insurance is provided by friends and family
